

CyberWav
Suite

The CyberWav Solution

“Productivity made simple...”

The CyberWav software suite is specifically designed for the busy professional office to increase communication and workflow of dictations and recordings. Using your PC workstations, network and Internet accounts, CyberWav provides expert business tools to connect you to your coworkers from any location . . . anytime.

Solution Overview

CyberRecorder™
Use your microphone or a specifically designed Philips SpeechMike to turn your PC workstation into a dictation and recording system. Use your network, E-mail or corporate Internet server to send recordings for transcription or archival.

CyberSynch™
This software encrypts, organizes and exports recordings from your portable digital recorder and PC workstation. Manually select who will receive your recordings or allow the software to automatically route your recordings over the network or the Internet.

CyberPlayer™
Equip secretaries and transcriptionists with a headset, foot pedal and software to retrieve, manage and playback your dictations and recordings.

CyberRecorder is a PC based application that allows the user to record their voice directly to a PC workstation. CyberRecorder will record the voice file then convert it into a digital file form and stores it on the computer's hard drive. Using a Philips professional grade dictation microphone with built-in control buttons such as Record, Rewind, Play and Fast Forward, enables the dictator a single-handed operation without a glance. CyberRecorder is capable of attaching a Client ID, Patient ID and Priority Status to follow each voice file. When using the compatible transcription software CyberPlayer, each dictator's demographics and recording information such as time, date, and dictation length can be viewed.

CyberSynch is a software companion to the Philips portable digital handheld recorder. Installed on a desktop or laptop computer, CyberSynch can be configured to automatically move recordings from your Philips digital handheld recorder to your computer's hard drive. Immediately send recordings based on workflow requirements. Voice and document files can be moved from your PC workstation using a corporate Internet server, office network directory and to an Internet E-mail account, while simultaneously archiving a copy of the voice file for safekeeping.

Give secretaries and transcriptionists the ability to turn their PC workstation into a transcriber with CyberPlayer. The software is used to transcribe dictated voice files from CyberRecorder and voice files transferred from CyberSynch. This transcription process can be used on any PC without interrupting other software applications. CyberPlayer can also assist in automatically returning word-processed documents back to the dictator. Secretaries and transcriptionists have full control of recordings with the adjustable volume, tone and speed controls. CyberPlayer includes a PC stereo headset and foot pedal for easy listening.

FEATURES AND BENEFITS

Dictate from office, home or hotel. Virtually anywhere you need to work using the Philips portable digital handheld recorder.

Use your own PC to dictate without interrupting other software applications.

Use the office network, Internet E-mail account or corporate Internet server to move recordings to the secretaries and transcriptionists who transcribe them.

Use CyberPlayer as you would a traditional transcriber.

Encryption for secure and sensitive information.

Let the software automatically back-up your recordings and send them for transcription according to your predefined workflow requirements.

When needed, you can manually select a transcription or storage location in batch or by individual recording.
